Team Unit #2

Feature List:
- **<u>DONE</u>** - Login page that offers log in or sign up
- **<u>DONE</u>** - User registration page
- **<u>DONE</u>** - User profile page with image upload
- **<u>DONE</u>** - Ability to ask questions
- Ability to answer questions
- Ability to vote questions up or down
- Search feature
- Admin profiles with more access than standard user
- **<u>DONE</u>** - Facebook web API integration

Ability to answer questions:

      Questions will have their own page that they are redirected to by a link on the home page. The page will display the title of the question, the content, and the author of the question. Users will then have the ability to see any responses, including the most up voted answer, as well as the ability to answer themselves.

Ability to vote questions up or down:

      Questions (and answers) will have an up vote and down vote option to order questions. This will allow us to display top questions on the front page, as well as allow users to see top voted responses on a question towards the top of the page.

Search feature:

      This search feature should search through titles of questions to return any questions that are similar to the content being searched. We may have to implement our own search function to properly search through the database, but we may also be able to find someone's code online, and attribute the work to them properly. The point of this feature is to search only.

Admin profiles:

      Admin profiles will be able to delete questions, as well as close questions so that no one else can answer them. This is important, as we need users that can patrol the site from time to time and make sure there are no inappropriate questions.
